

SubGrid - One-Page Summary

What it is

SubGrid is a static, in-browser tool that visualizes subscription spending as proportional layouts (grid/treemap, beeswarm, circle pack). It helps you see monthly and yearly totals at a glance and compare which services dominate your budget.

Who it's for

People who want a quick visual breakdown of their personal subscription costs.

What it does

- Add and edit subscriptions with price, billing cycle, currency, and URL.
- Visualize costs in a proportional grid (treemap) plus beeswarm and circle pack views.
- Compute monthly and yearly totals in the selected currency.
- Quick-add presets for popular services.
- Import bank CSVs and detect recurring charges as subscriptions.
- Export the visualization to PNG.
- Backup and restore data via JSON, stored in browser localStorage.

How it works

- Static assets: index.html, styles.css, and js/*.js served as a single-page UI (Tailwind via CDN).
- State and persistence: subs array in js/app.js saved to localStorage by js/storage.js.
- Rendering: treemap.js, beeswarm.js, circlepack.js compute layout and render DOM; modern-screenshot exports PNG.
- Import and presets: bank-import.js parses CSV and suggests recurring charges; presets.js seeds quick-add list.
- External services: exchange rates from <https://open.er-api.com> (cached daily) and logos from logo.dev.
- Backend/API: Not found in repo (static frontend only).

How to run

- From repo root, run 'npx serve .' or 'python -m http.server'.
- Open the local server URL in a browser.
